Locations and updating the software

You should update the software on all of your Garmin® devices when you install this device.

Software Update

You should update the software on all of your Garmin® devices when you install this device. The software update requires a Garmin NMEA 2000® Network Updater accessory or a Garmin chartplotter connected over the NMEA 2000 network (sold separately). Garmin devices support up to a 32 GB memory card, formatted to FAT32.

Loading the New Software on a Memory Card

You must copy the software update to a memory card using a computer that is running Windows® software.

NOTE: You can contact Garmin customer support to order a preloaded software update card if you do not have a computer with Windows software.

1 Insert a memory card into the card slot on the computer.
2 Go to www.garmin.com/support/software/marine.html.
3 Select GPSMAP Series with SD Card.
4 Select Download next to GPSMAP Series with SD Card.
5 Read and agree to the terms.
6 Select Download.
7 Choose a location, and select Save.
8 Double-click the downloaded file.
9 Select Next.
10 Select the drive associated with the memory card, and select Next > Finish.

A Garmin folder containing the software update is created on the memory card. The software update can take several minutes to load onto the memory card.

Updating the Device Software

Before you can update the software, you must obtain a software-update memory card or load the latest software onto a memory card.

1 Turn on the chartplotter.
2 After the home screen appears, insert the memory card into the card slot.

NOTE: In order for the software update instructions to appear, the device must be fully booted before the card is inserted.

3 Follow the on-screen instructions.
4 Wait several minutes while the software update process completes.
5 When prompted, leave the memory card in place and restart the chartplotter manually.
6 Remove the memory card.

NOTE: If the memory card is removed before the device restarts fully, the software update is not complete.

Mounting Considerations

Do not install or store the sensor near strong magnets, including speakers. A strong magnetic field can damage the sensor.

For best performance, observe these considerations when selecting a mounting location.

• The sensor should not be mounted near known ferrous metal objects such as a toolbox or compass.
• The sensor is not a GPS device and is not required to have a clear view of the sky.
• A handheld compass should be used to test for magnetic interference in the area where the sensor is to be mounted.

If the needle on the handheld compass moves when you hold it where you intend to mount the sensor, magnetic interference is present. You must choose another location and test again.

• The sensor should be mounted horizontally on a rigid surface for best performance.
• The sensor should be mounted with the cable facing toward the front of the boat for best performance.

NOTE: You can set the heading alignment automatically if a GPS source is connected to the NMEA 2000 network. If you are not using a compatible Garmin chartplotter, the boat must be able to reach a cruising speed of at least 6.4 km/h (4 mph). You can set or fine-tune the heading alignment using Fine Heading Alignment with a compatible Garmin chartplotter. If these options are not available, you must align the heading by adjusting the sensor installation manually to point the cable toward the front of the boat, parallel to the keel.

• Mounting screws are provided with the sensor. If you use mounting hardware other than the provided screws, the hardware must be made of quality stainless or brass material to avoid magnetic interference with the sensor.

NOTE: Test all mounting hardware with a handheld compass to make sure no magnetic fields are present in the hardware.

Registering Your Device

Help us better support you by completing our online registration today.

• Go to my.garmin.com.
• Keep the original sales receipt, or a photocopy, in a safe place.

Tools Needed

• Safety glasses
• Drill and drill bits
• Phillips screwdriver
• Cable ties
• Portable or handheld compass (to test for magnetic interference)
• Anti-seize lubricant (optional)
• Additional screws appropriate for the mounting surface, if needed

Important Safety Information

CAUTION
Always wear safety goggles, ear protection, and a dust mask when drilling, cutting, or sanding.

NOTICE
When drilling or cutting, always check what is on the opposite side of the surface.

NOTE: You can contact Garmin customer support to order a preloaded software update card if you do not have a computer with Windows software.

For best performance, observe these considerations when selecting a mounting location.

• The sensor should not be mounted near known ferrous metal objects such as a toolbox or compass.
• The sensor is not a GPS device and is not required to have a clear view of the sky.
• A handheld compass should be used to test for magnetic interference in the area where the sensor is to be mounted.

If the needle on the handheld compass moves when you hold it where you intend to mount the sensor, magnetic interference is present. You must choose another location and test again.

• The sensor should be mounted horizontally on a rigid surface for best performance.
• The sensor should be mounted with the cable facing toward the front of the boat for best performance.

NOTE: You can set the heading alignment automatically if a GPS source is connected to the NMEA 2000 network. If you are not using a compatible Garmin chartplotter, the boat must be able to reach a cruising speed of at least 6.4 km/h (4 mph). You can set or fine-tune the heading alignment using Fine Heading Alignment with a compatible Garmin chartplotter. If these options are not available, you must align the heading by adjusting the sensor installation manually to point the cable toward the front of the boat, parallel to the keel.

• Mounting screws are provided with the sensor. If you use mounting hardware other than the provided screws, the hardware must be made of quality stainless or brass material to avoid magnetic interference with the sensor.

NOTE: Test all mounting hardware with a handheld compass to make sure no magnetic fields are present in the hardware.
Before you can perform menu-based calibration, you must ensure the sensor has been calibrated successfully. If the sensor has not been calibrated successfully, a message appears each time you turn on a compatible chartplotter for best results. Depending on the types of devices connected to the NMEA 2000 network while the chartplotter detects the new sensor, you can calibrate the heading alignment.

### NMEA 2000 Connection Considerations

- This sensor connects to an existing NMEA 2000 network on your boat.
- If the included NMEA 2000 drop cable is not long enough to reach your NMEA 2000 network, a drop cable of up to 6 m (20 ft.) can be used, according to the NMEA 2000 guidelines.
- Do not use excessive force when installing mounting screws. Use only the amount of force needed to keep the sensor in place.
- Apply force evenly between the mounting screws.

#### Calibration

Calibration is recommended to ensure accurate heading data. After installation is complete, you must calibrate the heading alignment. The boat should not list during calibration. When the compass calibration is complete, a value appears near the Compass Cal. setting. A value near 100 indicates the sensor was installed in a perfect magnetic environment and calibrated correctly. If the heading performance is unacceptable, and the value is closer to 0 than it is to 100, you might need to relocate the sensor and calibrate the compass again.

1. From the sensor calibration screen, select Compass Cal.
2. Using a landmark or a known good compass, determine the heading of your boat.
3. Adjust the heading until it matches your measurement.
4. Select Done.

### Performing Basic Calibration

If you connect the sensor to a NMEA 2000 network without a compatible Garmin chartplotter, you must perform basic calibration instead of menu-based calibration. You must be able to view heading data from the sensor on a connected chartplotter or marine display before you can perform basic calibration. If you cannot view heading data on your connected display, check the NMEA 2000 network and power connections.

All other sources of heading data that are not based on GPS must be removed from the NMEA 2000 network while performing basic calibration. When performing basic calibration, you first calibrate the compass and then align the heading in one continuous procedure. If you installed the sensor with the cable pointing toward the bow, parallel to the keel, it may not be necessary to align the heading.

1. Drive the boat to a location with calm, open water.
2. Set the display to view heading data from the connected sensor.
3. Disconnect the sensor from the NMEA 2000 network or turn off the power to the NMEA 2000 network.
4. Wait while the boat becomes level and stationary.

### Performing Menu-Based Calibration

If you do not have a GPS source connected to the NMEA 2000 network, Auto Heading Alignment is not available as part of menu-based calibration, and you must adjust the Fine Heading Alignment instead.

- From the sensor calibration screen, select Fine Heading Alignment.
- Using a landmark or a known good compass, determine the heading of your boat.
- Adjust the heading until it matches your measurement.
- Select Done.

### Adjusting the Fine Heading Alignment

You can adjust the Fine Heading Alignment in conjunction with Auto Heading Alignment to fine-tune the heading output (optional).

1. From the sensor calibration screen, select Fine Heading Alignment.
2. Using a landmark or a known good compass, determine the heading of your boat.
3. Adjust the heading until it matches your measurement.
4. Select Done.

### Setup Requirements

#### Communications

<td>5</td>
<td>NMEA 2000 T-connector (included)</td>
</tr>
<tr>
<td>6</td>
<td>NMEA 2000 terminator or backbone cable (existing; not included)</td>
</tr>
</tbody>
</table>

TIP: You can open the calibration page at any time by following the on-screen instructions until the alignment is complete.
5 Turn on power to the sensor, and wait until the heading data appears on the display.

6 Within three minutes, complete two full, slow, tight circles, taking care to keep the boat as steady and level as possible. The boat should not list during calibration. If possible, you can turn the vessel in place by engaging two engines in opposite directions.

When the sensor is prepared to calibrate the compass, the heading data disappears from the display.

You may receive an error message that the heading was lost. You can ignore this message.

7 Continue turning in the same direction at the same speed for approximately 1 1/2 rotations until the heading data appears.

When the heading data appears, the compass has been calibrated successfully, and you can align the heading (optional).

8 Select an option.
   • If you want to align the heading to match the front of the boat, proceed to the next step.
   • If you installed the sensor with cable pointing toward the bow, parallel to the keel, and do not want to align the heading, stop turning and wait, keeping the boat stationary. Over the next two minutes the heading data should disappear and then reappear. When the heading data reappears, the compass should be calibrated and no heading offset should be applied.

   NOTE: If an unwanted heading offset is applied, you must disconnect all GPS sources from the NMEA 2000 network, and repeat the calibration. If the only available heading display is also a GPS source, you must repeat the calibration, and disconnect the sensor after step 7.

9 Continue turning in the same direction at the same speed for approximately ten seconds, until the heading data disappears from the display.

10 When it is safe, straighten the boat and drive in a straight line at cruising speed (must be at least 6.4 km/h (4 mph)) until the heading data appears.

   When the heading appears, the compass has been calibrated, and the heading has been aligned on the sensor.

11 Test the results of the calibration, and repeat this procedure if necessary.

Restoring Factory Default Settings
If you relocate the sensor or do not believe the calibration was successful, you can delete all calibration information from the sensor, and restore its factory default settings. After restoring the factory default settings, you must configure the sensor before you can use it with your system.

1 Select Settings > Communications > NMEA 2000 Devices > Device List.
2 Select the name of the sensor.
3 Select Review > Factory Defaults > Yes.
